THE PARTNERSHIP AT DRUGFREE.ORG
ASK THE EXPERT  A conversation with Steve Pasierb, President and CEO of The Partnership at Drugfree.org

As President and CEO of The Partnership at Drugfree.org, Steve Pasierb is a national leader on the topic of teen drug use and abuse. He is a frequent commentator for the national and local news media on drug safety issues and the current trends in teen drug use. In collaboration with Be Smart. Be Well., Steve is working to raise awareness of prescription and over-the-counter drug abuse and offers advice for keeping kids safe from drug use and abuse. See the complete video at besmartbewell.com/spotlight-newsletter.

BESMARTBEWELL: Why are young people abusing prescription drugs?

STEVE PASIERB: Kids are coming to prescription drug abuse for very specific reasons. Some aim to get high as a way of dealing with stress and depression in their lives. Some children are very tactical; they use prescription drugs in order to do better at school. So kids usually have a very sophisticated usage approach when it comes to these drugs. It is not just as simple as using them to go out and get wrecked.

BESMARTBEWELL: What over-the-counter drugs are most abused by teens and young adults?

STEVE PASIERB: What kids seek in over-the-counter drugs is an active ingredient in cough medicines, dextromethorphan, which gives them a drunk, dreamy, disassociated kind of feeling. Many kids become dependent on it, though. It has transitioned from a fringe behavior to something more mainstream. One in 10 kids in America have abused cough medicine.

BESMARTBEWELL: What is the right age to talk with your kid about drugs, and how do I go about it?

STEVE PASIERB: The average age of first-time drug use in America is about 13-and-a-half years old. We encourage parents to have an age-sensitive conversation, not a “big drug talk.” If your kids are in middle school, you can say: “What are you hearing in school? What is going on? Who are your friends?” That gets you in. As your kid ages, you should ratchet up the specificity of the conversation. Try, “What have you heard about this Ecstasy drug? Anybody in school talk about it?” This way, you’re not giving them a lecture on the harms of Ecstasy; you’re having a general conversation. The net of the conversation to your kid is that you’re worried, and that this isn’t an acceptable thing in your lives and family. That type of conversation is incredibly powerful, but it isn’t a lecture or a threat. Just a conversation.

# Prescription and Over-the-Counter Drug Guide

**A parent’s guide to the legal drugs kids are using and abusing**

**What is it?**

- **Hydrocodone bitartrate with acetaminophen**: Hydrocodone bitartrate is a prescription medication often combined with acetaminophen (which increases the effect of the hydrocode) to relieve moderate to severe pain. In the United States there are over 200 products containing hydrocode with acetaminophen (Vicodin, Lortab). Hydrocode is also combined with aspirin (Lortab ASA), ibuprofen (Vicoprofen) and antihistamines (Hycomine).

- **Barbiturates**: Barbiturates are central nervous system depressants that slow down the mind and body, causing drowsiness and sleepiness.

- **Benzodiazepines**: Benzodiazepines are among the most commonly prescribed depressant medications in the United States today. More than 15 different types of benzodiazepine medications exist. They are prescribed for relaxation, calmness, and relief from anxiety and tension. Some benzodiazepines are used to treat seizures or insomnia or other conditions.

- **Flunitrazepam**: Flunitrazepam may be prescribed to treat insomnia or given prior to anesthesia. It is a derivative of Benzo Diazepine. It is not available in the United States but is available in 60 other countries.

**Brand/Commercial Names**

- Hydrocodone bitartrate: Hocodan®, Loret®, Lortab®, Vicodin®, Vicoprofen®, Tussionex®, Norco®
- Barbiturates: Amytal®, Nembutal®, Seconal®, Phenobarbital, Tuinal
- Benzodiazepines: Ativan®, Halcion®, Librium®, Valium®, Xanax®
- Flunitrazepam: Rohypnol

**Street Names**

- Hydrocodone bitartrate: Vike, Watson-387, Hydro, Tuss
- Barbiturates: Barbs, Block Busters, Christmas Trees, Golf Balls, Pinks, Reds, Red Birds, Red Devils, Reds and Blues, Phenmies, Tooies, Yellows, Yellow Jackets
- Benzodiazepines: Sticks, BenZ, Footballs, Bars, French Fries, Ladders
- Flunitrazepam: R-2, Mexican Valium, Rophies, Roofies, Circle

**Looks Like**

- Tablets, Liquid
- Multi-colored tablets and capsules
- Tablets, Liquid
- Tablets (small olive green, oblong tablet with the number 542)

**How It Is Used**

- Swallowed
- Injected, Swallowed
- Injected, Swallowed
- Swallowed, Crushed, Snorted

**Dangerous Because**

- **Hydrocodone bitartrate with acetaminophen**: Side effects include: Sedation, respiratory depression and arrest, unconsciousness, coma, death.
- **Barbiturates**: Higher doses cause irritability, paranoia, suicidal thoughts, unusual excitement, fever, life-threatening withdrawal, impaired memory, judgment and coordination.
- **Benzodiazepines**: Side effects of abusing benzodiazepines include: Impaired motor coordination, drowsiness, lethargy, fatigue, impaired thinking and memory, confusion, depression, altered vision, slurred speech, staggering, vertigo, tremors, respiratory depression, nausea, constipation, dry mouth, abdominal discomfort, loss of appetite, vomiting, diarrhea.
- **Flunitrazepam**: Side effects of abusing flunitrazepam include: Impaired motor coordination, drowsiness, lethargy, fatigue, impaired thinking and memory, anterior grade amnesia, nausea, constipation, dry mouth, abdominal discomfort, loss of appetite, vomiting, diarrhea.

**Teen Usage**

- 1 in 5 teens have abused a prescription pain reliever.
- 1 in 11 12th graders have abused sedatives and tranquilizers.
- 1 in 11 12th graders have abused sedatives and tranquilizers in their lifetime.
- 1 in 11 12th graders have abused sedatives and tranquilizers in their lifetime.

**Important to Know**

- Most teens get their prescription drugs from their own family’s medicine cabinet. Fifty-five percent of teens agree it is easy to get prescription drugs from their parent’s medicine cabinets.
- Barbiturates mimic alcohol intoxication, causing mild euphoria, relief of anxiety and sleepiness. Abuse can lead to physical dependence and barbiturate withdrawal can be life-threatening.
- Abusing sedatives with alcohol can slow both the heart rate and respiration and possibly lead to death. Abuse can lead to physical and psychological dependency with serious withdrawal symptoms, including sweating, tremor, vomiting, anxiety, insomnia and muscle pain.
- Rohypnol has become infamous for being known as the “date rape drug” due to its ability to be easily mixed into liquids and fast acting side effects, coupled with short term memory loss. Abusing sedatives with alcohol can slow both the heart rate and respiration and possibly lead to death.

**Signs of Abuse**

- Nausea, constipation, confusion, euphoria, mental clouding, changes in sleep (increase when using, insomnia/irritability when withdrawing), acting as if in “stupor,” pinpoint pupils, problems with academics/extra-curricular activities.
- Slurred speech, shallow breathing, sluggishness, fatigue, disorientation, lack of coordination, dilated pupils.
- Long-term effects of benzodiazepines include: Slowed reflexes, mood swings, hostile and erratic behavior, euphoria, disorientation, confusion, slurred speech, muscle weakness, lack of coordination, impaired thinking, memory, and judgment.
- Slowed reflexes, long periods of sleep or drowsiness, memory loss, disorientation, confusion, slurred speech, muscle weakness, lack of coordination, impaired thinking, memory, and judgment.

## Amphetamine

It is a stimulant because it mimics the effect adrenaline has on the body. Amphetamines may be prescribed for the treatment of ADHD and a sleep disorder called narcolepsy.

**BRAND/COMMERCIAL NAMES**

- Biphetamine, Dexedrine®, Adderall®, Concerta®

**STREET NAMES**

- Bennies, Black Beauties, Crosses, Hearts, LA Turnaround, Speed, Truck Drivers, Uppers, Addies, A Train

**LOOKS LIKE**

- Tablets, Capsules, Powder

**HOW IT IS USED**

- Injected, Swallowed, Snorted

**DANGEROUS BECAUSE**

- Can cause rapid or irregular heartbeat, delirium, panic, psychosis, and heart failure.

**TEEN USAGE**

- 1 in 10 teens have abused Adderall or Ritalin

**IMPORTANT TO KNOW**

- Teens (12 to 17 years) who abuse stimulants are more likely to engage in other delinquent behavior such as fighting or selling drugs.
- Teens (12 to 17 years) who abuse prescription stimulants are more likely to experience a major depressive episode.

**SIGNS OF ABUSE**

- Reduced appetite, weight loss, nervousness, insomnia, aggressiveness, impulsive behavior, dilated pupils (can’t see eye color), high body temperature

## Methylphenidate

Methylphenidate is the most commonly prescribed central nervous stimulant use to treat ADHD. It may also be used to treat a sleep disorder called narcolepsy.

**BRAND/COMMERCIAL NAMES**

- Ritalin®

**STREET NAMES**

- JIF, MPH, R-ball, Skippy, The Smart Drug, Vitamin R

**LOOKS LIKE**

- Tablets

**HOW IT IS USED**

- Injected, Swallowed, Snorted

**DANGEROUS BECAUSE**

- Increased blood pressure, heart rate and body temperature; feelings of hostility and paranoia; serious cardiovascular complications, including stroke, dilated pupils

**TEEN USAGE**

- 1 in 10 teens have abused Adderall or Ritalin

**IMPORTANT TO KNOW**

- Many teens abuse prescribed stimulant medication to help them cram for exams or suppress their appetite.

**SIGNS OF ABUSE**

- Decreased sleep and appetite, increased alertness, attention span, energy

## Dextromethorphan (DXM)

Dextromethorphan (DXM) is an ingredient found in any cold medicine with the “DM” or “TUSS” in the title or name. In fact, DXM is in almost half of all the OTC drugs sold in the United States, making it easy to get, cheap, and legal.

**BRAND/COMMERCIAL NAMES**

- Any Cold Medicine with “DM” or “TUSS” in the title such as: Dimetapp DM®, Nyquil®, Robitussin®, Theraflu®, Vick’s Formula 44®

**STREET NAMES**

- Orange Crush, Triple C’s, C-C-C, Red Devils, Skittles, Dex, Vitamin D, Robo, Robo-trippin, Robo-dosing

**LOOKS LIKE**

- Cough medicine sold over the counter in drug stores and general stores

**HOW IT IS USED**

- Swallowed, Snorted

**DANGEROUS BECAUSE**

- Serious side effects include: Nausea, loss of coordination, headache, vomiting, loss of consciousness, numbness of fingers and toes, abdominal pain, irregular heartbeat, high blood pressure, seizures, panic attacks, psychosis, brain damage, addiction, insomnia, coma, death

**TEEN USAGE**

- Only 48 percent of teens believe taking cough medicine to get high is risky.
- Kids as young as 12 years are trying or using prescription drugs to get high.

**IMPORTANT TO KNOW**

- Nausea, loss of coordination, headache, vomiting, slurred speech, disassociation

**SIGNS OF ABUSE**

- Nausea, loss of coordination, headache, vomiting, slurred speech, disassociation
